

Nivel 1

Ejercicio 1

Creemos la tabla “credit_card” con el siguiente comando:

Decidimos que los campos id, iban y pan sean de tipo VARCHAR porque además de números pueden incluir espacios en blanco. Pin y cvv son de tipo INTEGER y expiring_date también será VARCHAR, pero luego de insertar los datos cambiaremos el formato para que puedan corresponderse a los de tipo DATE.

Definimos **id como PK**. Y en otra consulta, definimos también a id como la FK de la tabla transaction donde transaction.credit_card_id=credit_card.id. Ambas tablas tienen una **relación de N a 1 (transaction->credit_card)**, porque puede haber varias compras realizadas con una misma tarjeta.

The screenshot shows the Giaroli - S03* application interface. The top panel displays SQL commands:

```

12
13 #Creamos FK
14 • CREATE INDEX idx_transaction_credit_card_id ON transaction(credit_card_id);
15
16 • ALTER TABLE credit_card
17   ADD CONSTRAINT fk_transaction_credit_card_id
18   FOREIGN KEY (id) REFERENCES transaction(credit_card_id);
19
20 • DESCRIBE transaction;

```

The middle panel shows the 'Result Grid' with a table structure for 'transaction':

Field	Type	Null	Key	Default	Extra
id	varchar(255)	NO	PRI	NULL	
credit_card_id	varchar(15)	YES	MUL	NULL	
company_id	varchar(20)	YES	MUL	NULL	
user_id	int	YES		NULL	
lat	float	YES		NULL	
longitude	float	YES		NULL	
timestamp	timestamp	YES		NULL	
amount	decimal(10,2)	YES		NULL	

The bottom panel shows the 'Output' section with the following actions:

#	Time	Action	Message
136	13:56:20	ALTER TABLE credit_card ADD CONSTRAINT fk_transaction_credit_card_id FOREIGN KEY (id) REFERENCES transaction(credit_card_id);	0 row(s) affected Records: 0 Duplicates: 0 Warnings: 0
137	13:56:23	DESCRIBE transaction	9 row(s) returned

Una vez creada la tabla e ingresados los datos, podemos modificar los datos de `expiring_date` para lograr que sean de tipo `DATE` con los siguientes comandos.

The screenshot shows the Giaroli - S03* application interface. The top panel displays SQL commands:

```

302 #Modificamos formato del campo expiring_date para que tenga formato de tipo DATE en una nueva columna y luego
303 ## pero antes desactivamos el modo seguro de actualización y al final de la consulta lo volvemos a activar par
304 • SET SQL_SAFE_UPDATES = 0;
305 • ALTER TABLE credit_card ADD expiring_date_ok DATE;
306 • UPDATE credit_card SET expiring_date_ok = str_to_date(expiring_date, '%m/%d/%y');
307 • ALTER TABLE credit_card DROP COLUMN expiring_date;
308 • ALTER TABLE credit_card CHANGE expiring_date_ok expiring_date DATE;
309 • SET SQL_SAFE_UPDATES = 1;
310 • SELECT * FROM credit_card;

```

The middle panel shows the 'Result Grid' with a table structure for 'credit_card':

17	15:59:49	SELECT * FROM credit_card	275 row(s) returned

Para evitar futuros errores podríamos pedir al cliente que los nuevos datos de fechas de caducidad se registren con formato `YYYY-MM-DD`.

En el caso de que esto no sea posible, tal vez sería conveniente continuar con el formato `VARCHAR` o buscar alguna solución alternativa.

La **base de datos “Transactions”** queda entonces compuesta por **tres tablas**: **“Company”**, **“Credit_Card”** y **“Transaction”**.

DB TRANSACTIONS

Company y Transaction ya han sido comentadas en el Sprint1. La nueva tabla incorporada al modelo es Credit_Card, compuesta por 6 campos que permiten identificar cada tarjeta de crédito por su id. Este campo actúa como PK de la tabla y a la vez como FK con la tabla “Transaction”. Además, la tabla contiene información sobre el iban, pan, pin, cvv y fecha de caducidad de cada tarjeta.

La base de datos queda conformada como un **modelo estrella**, con la tabla **Transaction como tabla de hechos** y las otras dos como tablas de dimensiones.

Ejercicio 2

Para actualizar el IBAN del usuario con ID CcU-2938 realizamos los siguientes comandos:

SQL File 3

```

318
319 #corregimos el dato
320 • UPDATE credit_card
321 SET iban = 'R323456312213576817699999'

Ejercicio 3

Para poder ingresar un nuevo registro en la tabla Transaction, activamos y desactivamos el modo seguro de actualización con SET FOREIGN KEY CHECKS.

Luego actualizamos la tabla con el nuevo registro con el comando INSERT INTO. Al verificar los datos introducidos vemos que no se ha impreso timestamp así que lo hacemos en otra query (UPDATE).

Finalmente, revisamos que los datos introducidos sean correctos.

SQL File 3

```

330 • SET FOREIGN_KEY_CHECKS = 0;
331 • INSERT INTO transaction (id, credit_card_id, company_id, user_id, lat, longitude, timestamp, amount, declined)

Ejercicio 2

Para crear la vista VistaMarketing tenemos que crear una vista compleja, ya que utilizaremos datos de dos tablas, con funciones de agregación y agrupación.

En este caso tendremos en cuenta al booleano Declined ya que el enunciado pide las compras realizadas.

```

361 • CREATE VIEW VistaMarketing AS

The Output pane shows the following messages:

#	Time	Action	Message
345	15:30:54	CREATE VIEW InformeTecnico AS SELECT t.id as transaction_id, u.name as user_n...	0 row(s) affected
346	15:31:01	SELECT * FROM InformeTecnico ORDER BY transaction_id DESC	586 row(s) returned

Corroboramos que la cantidad de datos de la tabla transaction coincida con la de InformeTecnico para verificar que no haya errores.

The screenshot shows a SQL script in the editor and its execution results in the Output pane.

```

724 • SELECT COUNT(*) FROM InformeTecnico;
725 • SELECT COUNT(*) FROM transaction;
726 #Buscamos el registro extra que aparece en transaction pero no en InformeTecnico
727 • SELECT id
728 FROM transaction
729 WHERE id NOT IN (
730 SELECT transaction_id
731 FROM InformeTecnico);
732 #Es el registro añadido en el ejercicio 3 del nivel 1 que no tiene compañía registrada.
733 • SELECT *
734 FROM transaction
735 WHERE id = '108B1D1D-5B23-A76C-55EF-C568E49A99DD';

```

The Result Grid shows the following data:

id	credit_card_id	company_id	user_id	lat	longitude	timestamp	amount	decline
108B1D1D-5B23-A76C-55EF-C568E49A99DD	CcU-9999	b-9999	9999	829.999	-117.999	2024-03-08 10:41:45	111.11	0

The Output pane shows the following messages:

#	Time	Action	Message
350	15:32:06	SELECT id FROM transaction WHERE id NOT IN (SELECT transaction_id FROM I...	1 row(s) returned
351	15:32:17	SELECT * FROM transaction WHERE id = '108B1D1D-5B23-A76C-55EF-C568E49A99...	1 row(s) returned

Encontramos que Transaction tiene un registro más que InformeTecnico, es el registro añadido en el ejercicio 3 del nivel 1.

Decidimos eliminar la vista creada y crear una nueva haciendo una Left Join para incluir todas las transacciones:
